

CATAPULT GALILEO

API Endpoints & Types v5

This revision documents the updated agent call status model and the additional company-page fields currently available in app data but not consistently exposed in the interface.

LIFECYCLE STATES

6 statuses

NEGOTIATION OUTCOMES

6 outcomes

COMPANY METADATA

4 field groups

Status Model Change

Agent lifecycle and negotiation outcome are now treated as separate concepts. Lifecycle covers call progress. Outcome describes the result once the call is completed.

Important acceptance rule

Event acceptance should only unlock when an agent is COMPLETED and the outcome is RATE_CONFIRMED, shown in UI as **Deal Closed**.

Agent Lifecycle Status

INTERNAL ENUM	UI LABEL	MEANING	UI TONE
INITIALIZING	Queued	Worker created before the outbound call is placed.	Neutral
RINGING	Ringing	Twilio call placed and waiting for answer.	Live
ACTIVE	Negotiating	Call connected and Galileo is actively negotiating.	Live
WRAPPING_UP	Finalizing	Reserved for end-of-call wrap-up. Defined but not currently triggered.	Neutral
COMPLETED	Completed	Call ended and post-call analysis completed normally.	Success
FAILED	Failed	Twilio failure or unrecoverable call error.	Error

Negotiation Outcomes

INTERNAL ENUM	UI LABEL	MEANING	RESULT CLASS
RATE_CONFIRMED	Deal Closed	Supplier confirmed commercial terms and the deal can be accepted.	Acceptable
CALLBACK_REQUESTED	Callback requested	Supplier asked Galileo to reconnect later.	Follow-up

INTERNAL ENUM	UI LABEL	MEANING	RESULT CLASS
NO_AVAILABILITY	No Availability	Requested room inventory was unavailable for the target dates.	Closed Out
ESCALATED_TO_HUMAN	Moved to higher up	Supplier transferred the call to a manager or more senior owner.	Escalated
FAILED	Failure	Generic negotiation failure after the call completed.	Error
TIMED_OUT	Timed Out	Call reached the maximum negotiation duration.	Error

Company Page Data Not Fully Surfaced

The company experience already has additional data available in `dashboard-data.ts` that can be documented and exposed in future UI revisions.

Directory Card Fields

- `totalSavings`: aggregate savings shown on company cards.
- `bookings`: booking volume shown on company cards.
- `type`: hotel or airline classification used for iconography.
- `initials`: avatar token displayed in card and detail views.

Supplier Profile Fields

- `displayName`: richer supplier identity, for example Lumina Hospitality Group.
- `description`: long-form supplier summary used on the detail page.
- `id`: routing and lookup key for the company profile.
- `type`: shared with icon treatment and page labeling.

Location Analytics Data

- Per-location lifetime savings and delta values.
- Scope-specific agreement counts and subtitles.
- 1Y and ALL pricing series for negotiated versus market rates.
- Event-to-location associations for contextual filtering.

Suggested Exposure

- Show supplier profile metadata in the endpoint spec for company detail responses.
- Surface location analytics as an optional nested payload for company detail endpoints.
- Keep directory cards lightweight while documenting extended detail fields separately.
- Preserve current naming so the frontend can stay aligned with the app model.

Prepared for the Catapult dashboard workspace. Version 5 reflects the updated agent status labels and the currently under-documented company-page fields.
